

GO-TO-MARKET STRATEGY

Laundry Services Aggregator App

Ch G Priyanka | Laundry Hub

Document Overview

Section	Summary
1. GTM Objective	What success looks like at the end of Month 6
2. Target Segment	Who we launch for first and why
3. Value Proposition	The single reason this user should switch
4. Channel Strategy	Where and how we reach them
5. Phased Launch Plan	Now, Next, Later rollout timeline
6. Pricing Strategy	Three-tier model from pay-per-use to premium
7. PLG Loops	How the product grows itself after launch
8. Launch Campaigns	Six campaign types across the AARRR funnel
9. Success Metrics	KPIs at every stage of the funnel
10. Risks and Mitigations	What can go wrong and how we prepare

1. GTM Objective

The goal of this GTM is to take the Laundry Aggregator MVP to market in Bangalore, starting with three neighbourhoods in South Bangalore. The focus in the first six months is not growth at scale. It is proving that users who try the platform come back for a second order within 30 days. Once that behaviour is consistent, we scale.

North Star Metric

Repeat orders placed within 30 days of first use. This captures trust, habit formation, and platform value delivery in one number.

XYZ Hypothesis

At least 30% of users who place a first order will place a second order within 30 days. If 100 users place their first order in Month 1, at least 30 of them should reorder before Day 31.

2. Target Segment

An MVP never ships to the market. It ships to a specific person with a specific problem. We launch in one city, for one primary segment, with a tightly scoped value promise. Everything else waits.

Launch Segment: Working Professionals in South Bangalore

Dimension	Detail
Who	25 to 35 year old IT and corporate employees living alone or in shared flats in Koramangala, HSR Layout, and Indiranagar
Living situation	1BHK or 2BHK apartments with no washing machine or no time to use one
Frequency of need	Laundry need arises 2 to 4 times per month, making this a high-frequency pain point
Typical spend	Rs. 400 to Rs. 600 per order. They are not price-sensitive but they are value-sensitive.
Pain intensity	High. Missing a clean formal shirt before a work meeting is a real, recurring stress.
Tech comfort	High. Already using Swiggy, Blinkit, and Urban Company regularly.
Representative persona	Ravi, 30, IT employee. Lives alone in a 1BHK. Needs to book in under 2 minutes, forget about it, and receive clothes back without a single follow-up call.

Why this segment first

- They face this problem 2 to 4 times a month, not occasionally. High frequency means faster habit formation and stronger retention signals.
- They already pay for convenience apps. The mental model of booking a service on a phone is not new to them.
- They are concentrated in a small geography, which makes vendor supply planning easier in the early months.
- Word of mouth travels naturally within office groups and apartment WhatsApp chats, which is our lowest-cost acquisition channel.

Secondary segments to activate later

- Urban families in Phase 2, once vendor reliability is proven across enough orders
- Students in PGs in Phase 2, once a budget pricing tier is available
- Dry wash and specialty seekers in Phase 3, once specialty vendors are onboarded

3. Value Proposition

Segment	Core Promise
Working Professional	Book in 2 minutes. Forget about it. Get your clothes back on time with photos, a confirmed price, and zero follow-up calls on your end.

Urban Family	Reliable laundry that respects your time. Clean school uniforms, on time, every single week.
Student	The cheapest verified laundry near your PG. No surprise charges. No hidden fees.

Delta Utility

Today, users either call a vendor they heard about from a neighbour, or they search on Google Maps and hope for the best. Our platform replaces that anxiety with certainty. Verified vendors, price locked in before pickup, granular status updates, and a real escalation path when something goes wrong. That is the difference.

4. Channel Strategy

The rule is simple: test one channel, learn from it, then expand. We do not spread thin across every platform in the first month. We go deep in two channels first and add more only when the first two are working.

Channel	Why It Works	Tactic	Phase
Instagram and Reels	High reach among 25 to 35 year old urban professionals. Visual content travels well.	Short-form content: What actually happens to your clothes after you hand them over. Build curiosity around the tracking feature before showing the product.	Phase 1
Apartment WhatsApp Groups	Extremely high trust. Word of mouth from a neighbour converts better than any paid ad.	Seed referral codes in 10 to 15 apartment complexes near Koramangala and HSR. Offer Rs. 50 off for the first person in the group to share the link.	Phase 1
Google Search (SEO)	Captures high-intent users already searching for laundry pickup in Bangalore.	Local SEO with neighbourhood-specific landing pages for Koramangala, HSR Layout, and Indiranagar.	Phase 1 to 2
LinkedIn	Reaches the IT and corporate segment directly. Professional context adds credibility.	Before and after posts: Used to spend 20 minutes chasing my laundry vendor. This is what booking looks like now.	Phase 2
Referral Programme	Referred users trust the platform before they even install it. They also retain better.	Rs. 50 credit for every successful referral. One-tap share via WhatsApp.	Phase 2
Micro-influencers in Bangalore	Authentic endorsement from a lifestyle creator your target user already follows.	Productivity and morning routine creators with 10,000 to 50,000 followers. No mega-deals. Genuine usage only.	Phase 2

What we will not do in Phase 1

- No TV or outdoor advertising. Too broad, too expensive, and wrong audience density.
- No launch outside Koramangala, HSR Layout, and Indiranagar until vendor density in these three areas is strong enough.
- No B2B corporate tie-ups yet. Operations are not ready for volume commitments.
- No paid influencer deals. Trust needs to be earned through real user experiences first.

5. Phased Launch Plan

Phase 1: Seed (Month 1 to 2) - Validate the Core Loop

The goal here is not user volume. It is proof that the core order, track, and deliver loop works reliably enough that a user wants to come back. We cap daily orders intentionally so we can personally oversee every single one.

Action	Target	Owner
Onboard 20 verified vendors across Koramangala, HSR Layout, and Indiranagar before launch day	20 vendors live with verified profiles	Vendor ops
Launch on Android only, since Android has higher market share in our target segment	App available on Play Store	Engineering
Seed 15 apartment WhatsApp groups near tech offices in South Bangalore	300 app installs	Growth PM
Post organic content on Instagram 3 times a week, focused on the anxiety of not knowing where your clothes are	1,500 profile visits and 150 signups	Marketing
Offer Rs. 50 off the first booking to remove the cold-start hesitation	Convert 40 percent of signups into a first order within 7 days	Product
Handle every order manually with a dedicated ops person in Month 1 to catch every issue before it becomes a complaint	Zero unresolved complaints in Month 1	Ops

Phase 2: Launch (Month 3 to 4) - Build Habit and Trust

Now we start scaling acquisition because the core loop is proven. We activate the referral programme, expand to adjacent neighbourhoods, and start measuring D30 repeat rate seriously.

Action	Target
Launch referral programme with Rs. 50 credit for both referrer and the person they bring in	25 percent of new signups coming from referrals by end of Month 4
Roll out photo verification at pickup, which was listed as a Should Have in the MVP scope	Trust score improvement of at least 0.5 points in post-order surveys

Add the in-app issue reporting flow with photo upload for damaged or missing items	Issue resolution satisfaction score of 4 out of 5 or higher
Expand vendor coverage to Jayanagar, JP Nagar, and BTM Layout as the next cluster	50 percent of users within 3 km of a vendor
Run a win-back nudge on Day 21 for users who have not reordered after their first order	10 percent of lapsed users placing a second order
Launch iOS app	20 percent of new installs coming from iOS

Phase 3: Scale (Month 5 to 6) - Introduce Subscription and Expand

By this point we have enough order volume to introduce subscription tiers and enough data to know which vendor clusters are ready to scale. We also pilot the second city.

Action	Target
Launch Rs. 199 per month subscription with unlimited pickups and 10 percent off orders	15 percent of active users converting to the monthly plan
Launch Rs. 299 per month express tier with 4-hour turnaround	5 percent of active users on the premium plan
Pilot in Hyderabad with the same neighbourhood-first approach, starting with Madhapur and Gachibowli	1,000 active users in Hyderabad by end of Month 6
Launch vendor analytics dashboard so vendors can see their own ratings and order history	Vendor retention rate of 90 percent or higher

6. Pricing Strategy

The goal of pricing is to first build the habit and then make the subscription feel like the obvious choice. We do not push subscription at launch. We let users experience the product on pay-per-use, and then we show them the math.

Tier	Model	Price	Value Prop	Launch Phase
L1: Pay-per-use	15 percent commission on order value plus a Rs. 30 pickup fee per order	Around Rs. 100 to 150 per order depending on weight	Zero commitment. Try it once and see how it works.	Phase 1
L2: Laundry Monthly	Flat monthly subscription	Rs. 199 per month	Free unlimited pickups, meaning no Rs. 30 fee per order, plus 10 percent off all orders. Explained separately below.	Phase 3
L3: Laundry Pro	Premium monthly subscription	Rs. 299 per month	Everything in Laundry Monthly plus 4-hour express delivery for users who need clothes	Phase 3

			back the same day.	
--	--	--	--------------------	--

How the subscription saving actually works

The 10 percent discount alone does not justify the Rs. 199 subscription for most users. The real saving comes from the pickup fee waiver. A user placing 4 orders a month saves Rs. 30 per pickup, which is Rs. 120 saved on pickup fees alone. Add 10 percent off on say Rs. 2,000 of monthly orders, which is another Rs. 200 saved. Total saving is Rs. 320 against a subscription cost of Rs. 199. That is where the math becomes obvious and the conversion happens.

The in-app prompt that will drive conversion is: You have placed 4 orders this month. A monthly subscription would have cost you Rs. 199 and saved you Rs. 320. Switch now for next month.

7. Product-Led Growth Loops

Loop	How It Works
Viral Loop	When a user shares a referral code in their apartment WhatsApp group, the referral happens in a high-trust context. The person receiving it is already in the same neighbourhood and facing the same problem. Rs. 50 credit for both parties makes the share feel generous rather than spammy.
Sticky Loop	Order history, saved addresses, preferred vendors, and earned credits all accumulate in the app. Switching to a competitor means starting completely from scratch. Once a user has 5 orders and a saved address, leaving becomes inconvenient. The subscription tier locks this in further.
Expansion Loop	A user who starts with basic wash discovers dry clean, shoe wash, and ironing-only services on the same platform over time. New service types are visible on the browse screen and there is no need for a separate app. Average order value grows naturally as users explore.

The Aha Moment

The first time a user receives a push notification that says Washing in progress, with a photo of their clothes at the vendor facility, is when the product proves its core promise. That single notification is unlike anything the user has experienced with a local laundry vendor before. Every repeat order after that is built on that moment.

8. Launch Campaigns

Funnel Stage	Campaign	Channel	Message
Awareness	Laundry anxiety content series	Instagram Reels	What actually happens to your clothes after you hand them over? A three-part series that builds curiosity around the transparency feature before the product is revealed.
Acquisition	Apartment group	WhatsApp	First laundry pickup free for the

	seeding with first-order offer		first 50 users in your building. Hyperlocal scarcity makes this feel personal rather than a broadcast ad.
Activation	In-app nudge for users who signed up but have not ordered	Push notification	You installed the app 2 days ago. Your first order comes with Rs. 50 off. Booking takes 90 seconds.
Engagement	Reorder nudge on Day 14	WhatsApp and push	Your usual vendor has slots this weekend. One tap to rebook. Your address and preferences are already saved.
Retention	Win-back on Day 21	WhatsApp	It has been 3 weeks since your last order. Your favourite vendor has a slot tomorrow. Here is Rs. 30 back as a thank you.
Referral	Referral unlock after first completed order	In-app and WhatsApp	You have experienced the difference. Share it with someone in your building and both of you get Rs. 50 credit.

9. Success Metrics

The timeline below reflects a pre-MVP product. Month 1 targets are conservative by design. The first two months are about learning, not numbers. Scaling acquisition before the core loop is proven would be a waste of money and vendor capacity.

AARRR Stage	Metric	What It Means	Month 2	Month 4	Month 6
Awareness	App installs	Number of people who have downloaded the app	300	2,000	8,000
Acquisition	OTP-verified signups	Users who completed signup and verified their phone number	150	1,000	5,000
Activation	Signup to first order within 7 days	Out of 100 people who signed up, how many placed their first order within a week	40%	45%	50%
Engagement	Orders per active user per month	If you have 100 active users and they collectively place 200 orders that month, the average is 2.0. A score of 1.5 means most users ordered once and some ordered twice.	1.5	2.0	2.5
Retention	D30 repeat order rate	Out of 100 people who placed their first order, how many placed a second order	20%	28%	35%

		before Day 31			
Revenue	Monthly platform revenue	15 percent commission on total order value processed through the platform	Rs. 22,500	Rs. 1.5L	Rs. 5.6L
Referral	Percentage of new signups from referrals	Out of all new signups in that month, what share came through someone else sharing a referral code	5%	20%	30%

Most important number to watch every week

Signup to first order conversion rate. If this drops below 35 percent at any point, it means something in the activation flow is broken, whether that is the onboarding experience, the first-order offer, or vendor availability in a specific area. This number should be reviewed before any decision to increase acquisition spend.

10. Risks and Mitigations

Risk	Likelihood	Impact	Mitigation
Not enough vendors in the launch area. Users open the app and find no one nearby.	High	High	Do not launch until at least 20 verified vendors are live within the three target neighbourhoods. Show a notify me waitlist for users in uncovered areas so demand data is captured.
First experience is poor because vendor quality is inconsistent.	High	High	Every order in Month 1 is manually supervised. A strict onboarding checklist for vendors before their profile goes live. Full refund policy for the first 500 users, no questions asked, if quality falls short.
A competitor like Urban Company adds laundry aggregation to their platform.	Medium	Medium	Speed and vendor relationships are the moat here. Locking in preferred vendor agreements early and building up verified reviews and order history creates a barrier that takes months to replicate.
Operations get overwhelmed as order volume increases in Phase 2.	Medium	High	Hard cap of 50 orders per day in Month 1. Only scale the cap when SLA compliance stays at 95 percent or above for two consecutive weeks.
Users understand the subscription but do not convert because the saving is not obvious.	Medium	Medium	The in-app prompt shows the exact rupee amount the user would have saved that month. The math is done for them. No mental effort required.
Users are hesitant to hand over expensive clothes to a vendor they have never met.	High	Medium	Lead all acquisition messaging with the verified badge, photo-at-pickup feature, and the garment protection guarantee. The first-order refund policy is the strongest trust signal and should be prominent everywhere.

GTM in One Sentence

Launch in Koramangala, HSR Layout, and Indiranagar for Bangalore working professionals, earn trust through photo updates and price transparency, activate the referral loop from Day 30, and expand to adjacent neighbourhoods in Month 3 only after proving that users come back for a second order.
