

PRODUCT REQUIREMENTS DOCUMENT

Laundry Services Aggregator

PM Prep · Prodomaniacs

Author	Priya Chokkakula	Version	v1.0 — Draft
Product	Laundry Aggregator App	Date	May 2026
Vision	<i>To build India's most trusted network of verified laundry providers — delivering quality, transparency, and reliability in every order.</i>		

1. Problem Statement

Design a digital platform that aggregates local laundry vendors and allows customers to discover, compare, book, and track laundry services — all in one place.

Users who outsource laundry struggle to discover reliable providers, compare service quality, pricing, turnaround time, and trustworthiness efficiently. The current experience is fragmented, offline, and anxiety-inducing.

Core Issues

Issue	Detail
No reliable discovery platform	No platform exists beyond Google Maps to find nearby, verified laundry services.
No comparison capability	Comparing pricing, reviews, and service offerings (e.g. dry wash, shoe wash) is difficult and time-consuming.
No verification standards	Anyone can list on Google Maps with no accountability, quality checks, or safety standards.
No order transparency	Users have zero visibility once clothes leave their hands. Manual follow-up via phone is the only option.
No pricing transparency	Pricing is inconsistent and opaque across vendors — final amounts often differ from upfront estimates.
No guaranteed timings	Pickup and delivery schedules are verbal commitments with no enforcement or proactive communication on delays.

2. Who Is Affected

Target Segments

Segment	Description	Key Need
Urban working parents (families)	Managing household responsibilities, limited time, high dependence on reliable services.	Reliability — clothes ready on time for work and school.
Students in PGs / hostels	No washing machine access, cost-sensitive, need affordable and trustworthy options nearby.	Affordability + basic reliability.
Working professionals	Full-time employees with no time for chores; value outsourcing mental load.	Speed, convenience, and zero follow-up.
Dry wash / specialty seekers	Need specialty services (dry clean, shoe wash, delicate fabrics) not easily searchable on current platforms.	Service specialisation + quality assurance.

Frequency: Users face this problem at least twice a month — making it a high-frequency, high-frustration pain point worth solving.

3. Problems with Current Solutions

Problem	Impact on User
No vendor verification	Anyone can list on Google Maps. No quality standards or accountability enforced. Users can't trust a new vendor safely.
No price comparison	Pricing is inconsistent across vendors. No way to compare upfront. Final charge often differs from estimate.
No service clarity	Cannot see which vendor offers dry wash, shoe wash, or other specialty services before calling.
No order tracking	User has zero visibility once clothes leave their hands. Must follow up manually via phone or WhatsApp.
No guaranteed timings	Pickup and delivery schedules are verbal commitments with no proactive delay communication.
Limited payment options	Many vendors only accept cash, limiting user flexibility and leaving no digital payment trail.
No digital order record	No mutual space where both user and vendor can view order details and status simultaneously.
No pickup/delivery option	Some service providers don't offer home pickup. This is not clearly communicated anywhere before the user commits.
No issue resolution process	When garments are misplaced or damaged, there is no formal escalation path. Gaslighting is common.
Inconsistent quality	Same vendor delivers different quality across visits. No accountability mechanism exists.

4. User Research Insights

Primary user interview conducted with Rahul — a real user whose pain points informed the product direction.

Rahul · 34, UI/UX Designer · Bangalore

Dimension	Detail
Hobbies	Finding coffee places, gardening, trekking
Usage pattern	Uses laundry services rarely — after a trek or when work is particularly heavy
Discovery behaviour	Relies entirely on apps or services suggested by friends, colleagues, or the society WhatsApp group
Current spend	₹400–500 per order

Fears — With Emotional Drivers

Fear	Underlying Emotion
Delayed delivery time	Frustration of not showing up well-dressed for office — need for status and self-respect
Misplaced items	Losing a favourite clothing — attachment and sentimental value
The 'no weighing scale' trick	Fear of being cheated — deep trust issues with informal vendors
Damage to expensive clothing	Financial loss and regret
Bad customer support in a crisis	Fear of not being in control — feeling helpless with no information
Hygiene issues	Anxiety about cleanliness standards at the vendor facility
Guilt of outsourcing	Internal conflict about spending money on a task one 'should' be able to do themselves

Attitudes

- Likes to be stress-free; outsources tasks only when overwhelmed with work or events
- Likes to spend time outdoors — laundry competes with his leisure time
- Relies on reviews from people in his immediate circle

Preferences & Opportunities

- Prefers service providers who are nearby — proximity is a primary filter
- Wants shorter turnaround time and flexible pickup/delivery slots

- Wants realistic and specific pickup and drop time windows — not vague estimates

What Is Currently Working Well

Positive Experience	Why It Worked
Direct call from outlet manager when a garment had special needs — explained exactly how it would be washed	Gained trust, felt like he was dealing with professionals, not a generic service
Someone in charge giving updates on phone and resolving issues promptly	Human interaction reduced stress. Felt someone was accountable.
Vendor compensating for mistakes with offers	Human accountability — made him feel the vendor cared about getting it right

Current Dislikes

- Apps do not update users when pickup or delivery is delayed
- Gaslighting over lost or damaged items — vendors deny responsibility
- Changing pricing — final amount differs from initial estimate
- Being ghosted during critical delay situations
- Generic status updates like 'In Progress' that reveal nothing about what is actually happening

Rahul's Core Needs

Need	Why It Matters
Reliable delivery time	He plans his week around this. Uncertainty causes anxiety.
Transparent pricing	Surprise charges destroy trust immediately.
Quick issue resolution	When something goes wrong, speed of response determines whether he ever uses the service again.
Trustworthy handling	He has sentimental attachment to certain clothes. This is not just a functional concern.
Flexible slots	His schedule is unpredictable. Rigid slots don't work for him.

5. User Personas

Persona 1 — Urban Family (Segment 1)

Attribute	Detail
Name	Raju
Age	42
Location	Bangalore
Occupation	Business owner
Income	₹1.5L/month personal · ₹3.2L/month household
Attitudes	Outsources tasks that don't require his expertise. Prioritises free time with family.
Fears	Wasting time on mundane tasks. Kids not having clean uniforms before school. Clothes not ready in time for important family occasions.
Core Need	A reliable, hands-off laundry service that delivers on time — every time — without requiring him to follow up.

Persona 2 — Student (Segment 2)

Attribute	Detail
Name	Anvesh
Age	19
Occupation	Engineering student
Income	₹5,000/month (pocket money)
Attitudes	Spends most time on academics. Actively seeks offers and cheaper alternatives for everything. Will do something himself if outsourcing costs too much.
Fears	Overspending on anything. Being charged more than expected.
Core Need	The cheapest verified laundry option nearby, with transparent pricing upfront so there are no surprises.

Persona 3 — Working Professional (Segment 3)

Attribute	Detail
Name	Srija
Age	27
Occupation	IT employee

Attribute	Detail
Income	₹90,000/month
Attitudes	Outsources tasks that eat up her time. Does not mind spending money on things that remove physical or mental strain.
Fears	Having to track and remember too many things. Forgetting to follow up.
Core Need	A laundry service she can book, forget about, and receive back without a single manual follow-up or reminder to herself.

Persona 4 — Micro Persona / Main Interview Persona (Ravi)

Attribute	Detail
Name & Age	Ravi, 30
Occupation	IT Employee, Chennai — lives alone in a 1RK apartment
Motivation	Needs presentable office clothes daily. No washing machine. Wants weekends free for leisure and friends.
Behaviour	Outsources all household work, pays for quality services, reads reviews before trying anything new.
Fears	Missing out on fun doing boring chores. Hates physical tasks. Forgets to follow up on things.
Core Need	Book in under 2 minutes, forget about it, receive clothes back with zero follow-up calls.

6. Customer Journey Map (CJM)

Current State — Without Laundry Aggregator

Step	Stage	What Happens	Pain Points
1	Discovery	Customer seeks inputs from friends, colleagues, neighbours about their current laundry provider. Asks at least 2–3 people.	Time-consuming. No single source of truth. Entirely word-of-mouth.
2	Evaluation	Based on inputs received, customer decides on one service provider depending on needs.	Cannot compare objectively. Decision is based on limited, anecdotal data.
!	DROP-OFF 1	User cannot compare services — insufficient information to make a confident choice.	Many users give up or stick with a mediocre vendor out of inertia.
3	Ordering	Downloads the service provider's individual app, creates a profile, and places an order via phone or app.	No shared order record. Vendor may not pick up. Information given is vague.
!	DROP-OFF 2	Vendor unreachable, or fails to answer questions adequately.	User abandons and tries another vendor — restarting the whole process.
4	Pickup	Rider arrives based on availability. Weighs clothes and updates the app. Customer receives an approximate delivery time.	Vague ETA. No certainty. Pickup window is wide and unreliable.
5	Waiting	Customer waits with zero updates. Manually calls to follow up.	Anxiety and frustration. Customer feels out of control.
6	Delivery	Vendor delivers. Customer pays directly.	No receipt. No digital record. Cash-only in many cases.
7	Issue Resolution	In event of misplaced or damaged clothes, customer raises a ticket or calls the outlet directly.	Gaslighting is common. No formal escalation. Resolution depends on vendor's goodwill.

Future State — With Laundry Aggregator

Step	Stage	What Happens	Improvement Over Current
1	Discovery	Customer installs the app and signs up with phone number + OTP.	Single platform. No need to ask multiple people.
2	Browse & Filter	Customer selects service type and sees a list of verified nearby providers filtered by reviews, proximity, and price.	Verified vendors only. Full comparison in one screen.
3	Select & Book	Customer selects a vendor and a slot from available ones.	Real availability shown. No phone calls required.
4	Pickup	Rider arrives in the selected slot and updates weight and garments. Customer sees the exact price before confirming.	Price confirmed at pickup. No surprise charges later.
5	In Progress	Clothes arrive at vendor. User gets an image confirming this. Cleaning begins with granular status updates: Washing → Drying → Ironing → Packed.	Full visibility. No more 'In Progress' black box.
6	Issue Detected	If any issue with a garment is found, user gets an image of the item with the issue. A dedicated support agent calls to explain and get approval.	Proactive communication. User feels informed and in control.
7	Delay	If there is an unforeseen delay, customer is notified with reason via app and phone call. Revised ETA given.	Proactive delay communication. No ghosting.
8	Delivery	Clothes delivered in a user-selected slot. User tracks the rider.	Slot flexibility at delivery. Live tracking.
9	Payment & Review	User pays via preferred method on the app. Issues can be reported in-app with photo evidence.	Digital payment trail. Structured issue resolution flow.

Possible Drop-offs

Drop-off Point	Cause	Mitigation
OTP step	User hesitates to share phone number with a new app	Explain why phone number is needed. Minimal data collection — no email required at signup.
Vendor listing	Not enough vendors listed in user's area	Show 'notify me when vendors are available' option. Collect location demand data for onboarding decisions.
Service not listed	User's required service (e.g. specific fabric care) not available	Show related services. Allow users to submit service requests.
No available slot	User's preferred pickup time is not available	Show next 3 available slots prominently. Allow same-day bookings where possible.

7. Jobs To Be Done (JTBD)

Job	Situation	Motivation	Desired Outcome
Provider Selection	When I need laundry services	I want to quickly identify a reliable nearby provider	So I can avoid spending time asking multiple people and feel confident in my choice
Issue Visibility	When unexpected issues occur with my order	I want timely and transparent communication	So I can feel informed and in control rather than helpless
Pricing Transparency	When placing a laundry order	I want to understand the expected total cost upfront	So I can avoid surprise charges later and plan my budget
Process Transparency	When my clothes are being processed	I want visibility into what stage they are in	So I can feel reassured and reduce uncertainty while waiting
Lost Item Handling	When a garment is lost or misplaced	I want immediate support and frequent updates	So I can feel that the issue is being taken seriously and resolved

8. Value Proposition

Existing Solutions and Their Gaps

Solution	Gap
Individual vendor apps	Isolated, no comparison, no price transparency, no cross-vendor accountability. Switching requires starting fresh on a new app.
Google Maps / Search	Discovery only — no booking, no tracking, no verification. Purely offline from the point of finding a vendor.
Urban Company	Premium pricing, limited vendor variety, inconsistent availability. Cancels on users. Not accessible to budget-conscious segments.

Delta Utility

The only platform that lets you compare, book, and track multiple local laundry vendors in one place — saving time, reducing uncertainty, and giving you price transparency before you commit. Backed by vendor verification, real photo updates, and human accountability when things go wrong.

How We Beat Current Solutions

Current Problem	Our Solution
No UI/UX for slot clarity	Show exact slots available when riders are available for pickup and delivery.
No upfront pricing	Show estimated total before order confirmation. Confirm exact amount at pickup after weighing.
Generic delay communication	Provide reason for delay + photo updates + revised ETA — not just a vague 'delayed' notification.
Poor issue resolution	Dedicated support agent per critical issue. Guaranteed response time. Escalation path visible to user.
No comparison platform	Single screen to compare all available nearby laundry services.
Fake or incentivised reviews	Unpaid, verified reviews from confirmed orders only.

9. Market Sizing

Level	Calculation	Result
TAM — Total Addressable Market	Urban India population: ~500M Urban households: ~130M Households outsourcing laundry: ~30% = 39M households Average spend: ₹500/month = ₹6,000/year $39M \times ₹6,000/\text{year}$	₹2,34,000 crore
SAM — Serviceable Addressable Market	Total Bangalore households: ~35 lakh (3.5M) Households outsourcing laundry: ~20% = 7 lakh households Average spend: ₹6,000/year $7,00,000 \times ₹6,000/\text{year}$	₹420 crore
SOM — Serviceable Obtainable Market (Year 1)	Targeting 2% of SAM in Year 1. $2\% \text{ of } 7,00,000 = 14,000 \text{ households}$ Platform revenue per user: ₹750/year (15% commission on ₹6,000 spend) $14,000 \times ₹750$	₹1.05 crore

Why Now: Rising urbanisation, increasing comfort with app-based services, and UPI adoption across all income segments make this the right moment to aggregate a market that has been stubbornly offline.

10. MVP Scope

Feature	Description	Priority
Verified vendor listings	Price, distance, turnaround time, and ratings visible upfront for each vendor. Verified badge backed by documentation.	Must Have
Filter & sort	Filter by service type (basic wash, dry clean, ironing, shoe wash). Sort by price, rating, distance, delivery time.	Must Have
Order placement	End-to-end booking flow with slot selection. Mutual order visibility for both user and vendor.	Must Have
Real-time price confirmation	Rider weighs clothes at pickup. Exact price confirmed before pickup is finalised. No post-delivery surprises.	Must Have
Granular order tracking	Status updates: Clothes Collected → Washing → Drying → Ironing → Packed → Out for Delivery.	Must Have
Proactive delay notification	Push notification + reason + revised ETA — not just a generic 'delayed' message.	Must Have
Digital payment	UPI, card, wallet supported. Cash on delivery option for first orders.	Must Have
Photo verification at pickup	Rider takes photos of garments at pickup. User can see and confirm before clothes leave.	Should Have
Issue reporting flow	In-app dispute flow with photo upload. Dedicated support agent assigned for critical issues.	Should Have
Price change audit trail	If price changes after order, user sees: old price, new price, reason, timestamp. Must approve before proceeding.	Should Have

What We Will NOT Build in V1: QR/barcode tagging per garment (high ops effort), AI chatbot recommendation assistant (requires usage data), predictive delay engine (requires historical data), vendor reliability score (requires sufficient order volume), subscription / repeat order scheduling (V2 retention feature).

11. Opportunity Solution Tree

Each opportunity is a user pain point from research. Each solution is a feature that addresses it. Each experiment validates the feature before full build.

Opportunity 1 — Users struggle to identify reliable nearby providers

Solution	Experiment	What to Measure
Laundry aggregator app with filters (price, turnaround time, ratings, distance)	Show users a low-fidelity screen with all 4 filters. Measure: time taken to select a provider, satisfaction score after selection.	Time to select provider · Satisfaction score (1–5)
Conversational AI chatbot — user describes needs and gets personalised recommendations [BACKLOG]	Track what users type in search and which filters they use most. Build chatbot only when patterns emerge.	Common search terms · Most-used filters · Drop-off on unfiltered browse

Opportunity 2 — Users lose trust when garments are misplaced

Solution	Experiment	What to Measure
QR/barcode tagging per clothing item — scan to see garment status: Picked up → Washing → Ironing	A/B test: 50% of users get barcode-tagged garments, 50% do not. Compare missing garment complaint rate between groups. User interview to check if tags are an inconvenience.	Trust score (1–5) · Missing garment rate · User preference %
Photo verification at pickup and delivery — photos captured at every handover point	A/B test: 50% see 'Pickup completed' status only, 50% see pickup status + photos of garments. Compare trust scores and dispute resolution time.	Trust score · Dispute reduction rate · Preferred flow %
Priority Resolution Support — dedicated support agent, guaranteed callback within 15 mins, escalation path	Ask users: do you prefer chat or call support for critical issues? Show them the Priority Ticket UI. Measure resolution satisfaction and trust increase.	Resolution satisfaction · Trust increase · Preferred response channel
Compensation policy for lost or damaged items — displayed on vendor profile	Show two vendor cards side by side: identical rating, one with and one without a garment protection guarantee. Measure which vendor users choose.	Provider choice % · Trust score · Decision time
Vendor Reliability Score [BACKLOG — requires sufficient order data]	Display the % of misplaced/lost garments from previous orders alongside vendor rating. Measure whether it influences selection.	Trust score · Decision time · CTR on reliability info

Opportunity 3 — Users feel anxious due to lack of transparency and communication

Solution	Experiment	What to Measure
Proactive issue notification system — push notification, SMS, WhatsApp, phone call for critical cases	Show two notification screens: Screen A: 'Delivery delayed.' Screen B: 'Delivery delayed by 30 mins due to heavy rainfall. Updated ETA: 6:30 PM.' Compare trust scores.	Trust score · User satisfaction · Preference %
Communication channel preference survey	Ask users: 'How would you prefer to receive critical updates?' Options: push notification, SMS, WhatsApp, phone call. Test across 3 scenarios: delay, garment issue, pickup rescheduled.	Channel preference ranking · % preferring each channel per scenario
Live order tracking with granular status + revised ETA	A/B test: Screen A shows 'In Progress.' Screen B shows 'Washing completed  Ironing in progress  Updated ETA: 6:30 PM.' Compare anxiety reduction and trust scores.	Trust score · Anxiety reduction score · User preference %
ETA accuracy experiment	Scenario A: ETA of 5:00 PM, delivery at 6:00 PM (no update). Scenario B: ETA updated to 6:00 PM, delivery at 6:30 PM with reason. Measure which feels more reliable.	User satisfaction · Perceived reliability score · Trust score

Opportunity 4 — Users dislike price discrepancies between estimate and final charge

Solution	Experiment	What to Measure
Real-time price confirmation at pickup — rider weighs at customer location, customer sees final amount before confirming pickup	Show two flows: Flow A: user sees estimated price before booking only. Flow B: user sees estimated price + confirmed price after weighing at pickup, before handing over. Measure trust and abandonment.	Trust score · Pickup confirmation rate · Dispute rate
Special-care approval workflow — if delicate fabric or special treatment detected, vendor sends in-app approval request with updated price before proceeding	Test two flows: Flow A: price updated silently, user sees new total at payment. Flow B: in-app approval request 'Special care required for 2 items. Additional ₹50. Proceed?' Measure approval rates and trust.	Approval rate · Trust score · Dispute rate
Price change audit trail — visible log of any price changes with reason and timestamp	Show users two summary screens: one with and one without the audit trail. Measure preference and trust score.	User preference % · Trust score (1–5)

Opportunity 5 — Users feel disconnected due to generic status updates

Solution	Experiment	What to Measure
Enhanced status tracking — replace 'In Progress' with granular steps: Clothes Collected → Washing → Drying → Ironing → Packed → Out for Delivery	A/B test: Control sees 'In Progress.' Variant sees granular steps with timestamps. Compare anxiety reduction score, trust score, and support ticket volume.	Trust score · Anxiety reduction · Support ticket volume
Process photo updates — pickup image, washed clothes image, packed clothes image at key milestones	A/B test: 50% see only status text, 50% see status + photo. Measure trust score and preference.	Trust score · User preference % · Dispute rate
Progress timeline with timestamps — e.g. 10:30 AM Picked up → 11:45 AM Washing completed → 1:20 PM Ironing started → 3:45 PM Packed → 5:30 PM Out for delivery	Show users this timeline in a prototype test. Measure satisfaction and anxiety reduction vs. no-timeline control.	Satisfaction score · Anxiety reduction score

12. Success Metrics

AARRR Stage	Metric	V1 Target
Activation	% of signups who place a first order within 7 days	35%
Activation	Order placement completion rate (vendor profile view → order confirmed)	40%
Activation	Time to place first order (app open → confirmation)	Under 4 minutes
Engagement	% of users who return to place a second order within 14 days	30%
Retention	D30 retention — % of first-time users still ordering on Day 31	25%
Trust	Average trust score after first order (1–5 survey)	4.0+
Trust	Dispute rate — % of orders that result in a garment issue complaint	Under 2%
Revenue	Platform GMV (Month 3, Bangalore only)	₹8–10 lakh/month

XYZ Hypothesis: At least 40% of users who view a vendor profile will complete an order placement within the same session.
